Immunol. 5:1239-1249 (1993).

-i. FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha, MIP-1 delta, RANTES, and MCP-3 and, less efficiently, to MIP-1-beta or MCP-1 and subsequently transduces a signal by increasing the intracellular calcium ions level. Responsible for affecting stem cell proliferation.

-i. SUBCELLULAR LOCATION: Integral membrane protein.

-i. TISSUE SPECIFICITY: Widely expressed in different hematopoietic

Natl. Acad. Sci. U.S.A. 91:9794-9798(1994).
-!- FUNCTION: DNA-dependent RNA polymerase catalyzes the transcription of DNA into RNA using the four ribonucleoside triphosphates as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -1-SUBINIT: In chloroplasts, the RNA polymerase is composed of four subunits: alpha, beta, beta', and beta'.
-1-SUBICELLULAR LOCATION: Chloroplast.
-1-SIMILARITY: Belongs to the RNA polymerase beta chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA}(N).
                                                                                                                                                                              Chloroplast.

U. Immunol. 164:4048-4054(2000).

-I-FUNCTON: High affinity receptor for the C-C type chemokines TARC/SCTA17 and MUC/SCTA22. The activity of this receptor is mediated by G(i) proteins which activate a phosphatidylinositol-calcium second messenger system. Can function as a chemoatrzactant homing receptor on circulating memory lymphocytes and as a coreceptor for some primary HIV-2 isolates. In the CNS, could mediate hippocampal-neuron survival.

-I-SUBELLUIAR LOCATION: Integral membrane protein.

-I-TISSUB SPECIFICITY: Predominantly expressed in the thymus, in peripheral blood leukocytes, including T cells, mostly cd4+ cells, and in monocytes. Detected also in macrophages, IL-2-activated natural killer cells and skin-homing memory T cells, mostly the ones expressing the cutaneous lymphocyte antigen (CLA). Expressed in brain microvascular and coronary artery endochelial cells. PHOSPHORYLATION ON YET UNDERSIA BNOST PROBABLY BY BASHORYLATION ON YET UNDERSIA BNOST PROBABLY BY HELLEY, ADRERGIC RECEPTOR KINASES I AND 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright.       Buser R., Conquet F., Proudfoot A.E.I., Wells T.N.C., Power C.A.; "A key role for CC chemokine receptor 4 in lipopolysaccharide-induced endotoxic shock.";
                                                  1. EXP. Med. 1911/755-1764 (2000).

-1- FUNCTION: High affinity receptor for the C-C type chemokines TARC/SCYA17 and MDC/SCYA20. The activity of this receptor is mediated by G(1) proteins which activate a phosphatidylinositolalipopolysaccharide (LPS)-induced endotoxic shock. In the CNS, could mediate hippocampal-neuron survival.
-1- SUBCELLULAR LOCATION: Integral membrane protein.
-1- TISSUE SPECIFICITY: Expressed in the thymus, macrophages and T-
                                                                                                                                                                                                                 yolk sac.
-!- PTH: IN NATURAL KILLER CELLS, SCYA22 BINDING INDUCES
PHOSPHORYLATION ON YET UNDEFINED SER/THR RESIDUES, MOST PROBABLY
BY BETA-ADRENERGIC RECEPTOR KINASES 1 AND 2 (BY SIMILARITY).
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (GLCNAC. . .)                                                                                                                                                                                                                                                                                                                                                                                               3D-structure.
```

```
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SUBCELLULAR LOCATION: Integral membrane protein coupled receptors.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
      THROUGH THE ACTION OF G PROTEINS. PRIMARY TRANSDUCING EFFECT IS ADENTIATE CYCLASE INHIBITION.
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                MGD; MGJ: 58337; CLIMIL.
INTERPO: JPR000276; GPCR_Rhodpsn.
PEAM; PF00001; 7tm 1; Jr.
PRINTS; PR00237; GPCRHODOPSN.
PROSITE; PS00262; G_PROTEIN RECEP_F1_2; 1.
PROSITE; PS50262; G_PROTEIN RECEP_F1_2; 1.
POSTSYNAPTION; Multigene family; G-protein coupled receptor.

"Molecular cloning of m3 muscarinic acetylcholine receptor in rat
iris."

"Molecular cloning of m3 muscarinic acetylcholine receptor in rat
iris."

"Smooth Muscle Res. 34:111-122(1998).

-!- FUNCTION: THE MUSCARINIC ACETYLCHOLINE RECEPTOR MEDIATES VARIOUS
CELLULAR RESPONSES, INCLUDING INHIBITION OF ADERYLATE CYCLASE,
BREAKDOWN OF PHOSPHOINOSITIDES & MODULATION OF POTASSIUM CHANNELS
THROUGH THE ACTION OF G PROTEINS. PRIMARY TRANSDUCING EFFECT IS
ADENYLATE CYCLASE INHIBITION.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                           Rattus norvegicus (Rat).
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Rattus.
                                                                                                                                                                                                                                                                       "Primary structure of rat cardiac beta-adrenergic and muscarinic cholinergic receptors obtained by automated DNA sequence analysis: further evidence for a multigene family."; Proc. -!- FUNCTION: Receptor for a C-C type chemokine. Binds to eotaxin, MCP-3, MCP-4 and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level.

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                               15-JUL-1998 (Rel. 36, Created)

Biol. Chem. 265:2828-2834(1990).

-!- FUNCTION: The muscarinic acetylcholine receptor mediates various cellular responses, including inhibition of adenylate cyclase, breakdown of phosphoinositides and modulation of potassium channels through the action of G proteins. Primary transducing effect is inhibition of adenylate cyclase. May couple to multiple functional responses in cell lines.
-!- SUBCELLULAR LOGATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            omatus garino (unicosm).

## ALIGNMENTS

```
The present invention describes a number of peptides which are able to bind to HIV glycoprotein 120 (gp120). These are similar to the human chemokine receptors CCRS, CXCR4 and STR13, as well as CD4. These are useful in the treatment of HIV, as they prevent replication of the virus. The present sequence is an example of a peptide of the invention
                                                                                                                                                          Human chemokine receptor; CD4; HIV; glycoprotein 120; gp120; antagonist;
replication; CCR5; CXCR4; CD4; STRL33.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polypeptides useful for treating HIV infection, have homology to regions of domains of human chemokine receptors CCR5, CXCR4 and STRL33, and binds to HIV gpl20 under physiological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention relates to nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCR5 or of other chemokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCR5 derived peptides, or compounds derived from the protein of the invention of the invention of the invention would block HIV infection. The present sequence is human chemokine receptor CCR5 C-terminal fragment deletion mutant which is incapable of interacting with the protein of the invention
                                                                                                                                                                                                                                Nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCRS isolated from a human B cell cDNA library is useful to detect, treat and prevent HIV infection.

The invention relates to nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCR5 or of other deneokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCR5 derived peptides, or compounds derived from the protein of the invention (e.g. antagonist or mutants) that disrupt binding of CCR5 to the protein of the invention would block HIV infection. The present sequence is human chemokine receptor CCR5 C-terminal fragment deletion mutant which is incapable of interacting with the protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCRS isolated from a human B cell cDNA library is useful to detect, treat and prevent HIV infection.
                                                                      Nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCR5 isolated from a human B cell cDNA library is useful to detect, treat and prevent HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nucleic acid encoding a protein which interacts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human CCR5 chemokine receptor C-terminal mutant fragment (aa 295-352)

with the carboxy terminus of the chemokine receptor CCRS or of other chemokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCRS-derived peptides, or compounds derived from the protein of the invention (e.g. antagonist or mutants) that disrupt binding of CCRS to the protein of the invention would block HIV infection. The present sequence is human chemokine receptor CCRS C-terminal mutant fragment which is incapable of interacting with the protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCR5 or of other chemokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCR5 derived peptides, or compounds derived from the protein of the invention and thock HIV infection. The present sequence is human chemokine receptor CCR5 C-terminal fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human CCRS chemokine receptor C-terminal fragment (residues 295-352).
                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Essential for binding to human protein P2 (AAE14754)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid encoding a protein which interacts with the carboxy of the chemokine receptor CCR5 isolated from a human B cell cDNA is useful to detect, treat and prevent HIV infection.

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory or CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; antidiabetic; anorectic; cerebroprotective; neuroprotective; antiinflammatory; gene therapy; antisense therapy; thyromimetic; NOVX; pathology; cancer; diabetes; obesity; endocrine disorder; CNS disorder; inflammatory disorder; chromosome mapping; tissue typing;

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide compirising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and infilamatory disorders. They can also be used in various detection and screening assay, chromosome mapping, itseue typing and predictive medicine. This sequence corresponds to one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dipippo VA, Edinger SR, Eisen A, Ellerman K, Catterton E, Gerlach VA, Edinger SR, Eisen A, Ellerman K, Gangolli EA; Gerlach VL, Gorman L, Guo K, Herrmann JL, Hjalt T, Ji W, Kekuda R, Khramtsov NV, Li L, Liu X, Malyankar UM, Miller CE, Millet I; Rotramtsov NV, Ei E, Esturajan W, Pena CEA, Rastelli L, Rieger DK; Rothenberg ME, Shenoy SG, Shimkets RA, Shithson G, Spaderna SK; Spytek KA, Stone DJ, Vernet CAM, Zhong H, Zhong M, Alsobrook JP; Burgess CE, Lepley DM;

This protein comprises human WMLR-CCR, a novel C-C chemokine receptor associated with monocyte/macrophage infiltration and chemotaxis and haematopolesis. The amino acid sequence was deduced from a cDNA clone (see AAT99542) obtained from a cDNA library made from monomuclear cells collected on day 2 of a mixed lymphocyte culture, i.e. cells associated with inflammation and immunomodulation. Another novel chemokine receptor, MHG-CCR (see AAN36767), is also claimed. MALR-CCR contains 7 transmembrane spanning segments connected by a serives of intracellular and sextracellular loops. MMLR-CCR and be used to study, diagnose and treat disease states in which normal leukocyte function is perturbed by normal leukopoiesis or inappropriate activation via proliferative disease, tumourigenesis, autoimmune disease, abnormal cell proliferation, solid tumours, cardiovascular disease, abnormal cell arthmis, anyasthenia gravis, diabetes, inflammatory bowel disease, toxic shock syndrome, septic shock and Chediak-Higashi syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RAWIES chemokines, but not by monocyte chemoattractant protein 1 (MCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines, Active CCR-5 is also a receptor of human immundeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid psoriasis, viral infections, asthma, idiopathic pulmonary fibrosis and autoimmune disorders
                                                                                                                                                      Human Cys-Cys chemokine receptor 5; CCR5; human immunodeficiency virus; type 1; type 2; HIV-1; HIV-2; diagnosis; treatment; prevention; inflammatory disease; rheumatorid arthritis; glomerulonephritis; asthma: idiopathic pulmonary fibrosis; psoriasis; viral infection; cancer; atherosclerosis; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Active and inactive forms of human CC chemokine receptor CCR-5 - useful to diagnose, prevent and/or treat inflammatory disorders, autoimmune disease and viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 95; DB 2; Length 352; 100.0%; Pred. This polypeptide sequence comprises novel human chemokine receptor 88C, a grotein coupled receptor that is involved in leukocyre trafficking. Its amno sequence was deduced from a cDNA clone (AAT85161) isolated from a macrophage library. It shows 62% identity to CCCKR1. Chemokine receptor and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be brotein binding, and are potentially posentially useful in the treatment of atherent acceptor activities, particularly ligand and G protein binding, and are potentially posentially useful in the treatment of atherents; rheumatoid arthritis, tumours, asthmaty viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 infection, AIDS, inflammatory conditions, pathological immune response,

```
Novel human mature G-protein chemokine receptor HDGNR10 (AAW07602) is a 7-transmembrane protein involved in signal transduction. Its amino acid sequence was deduced from a cDNA clone (AAM44042) isolated from a human moncoyte library. Isolation of the cDNA allows prodn. of recombinant HDGNR10 in host, e.g. E. coli, COS or Sf9, cells. The recombinant sceptor can be used to identify agonists or antagonists of the receptor; such cpds. can be used to treat conditions related to the under- and over-expression of G-protein chemokine receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC chemokine receptor 5; CCR5; G-protein coupled receptor; human immunodeficiency virus; HIV; CD4; AIDS; therapy; transgenic animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This polypeptide sequence comprises macaque chemokine receptor 88C, a G protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a 88C DNA (AAT85163) isolated by PCR amplification. It shows 97% identity to human 88C (AAW27123). 88C receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and grotein binding, and are potentially potentially useful in the treatment of atheroslerosis, rheumatoid arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune response, abnormal haematopoietic processes etc. A hybridoma that produces an antibody that specifically binds to macaque 88C is claimed
                                                                                                                          Chemokine réceptor 88C; atherosclerosis; rheumatoid arthritis; tumour; sathma, viral infection; AIDS; inflammation; autoimmune disease; therapy; disquosis; leukocyte trafficking; G protein coupled receptor; ligand; modulator; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding chemokine receptors 88-2B and 88C - used to modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, auto-immune diseases, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The sequence was deduced from an isolated cDNA clone (see AAT76920). An Ala127Leu variant (see W238340 of CCR5 was also identified. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 and CCR5. CCR5 is a member of the 7-transmebrane superfamily of G-protein coupled cell surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that coexpress human CD4 and CCR5 provides valuable tools for research of HIV infection. Antibodies that bind to CCR5. CCRS variants, and CCR5-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage tropic strains
                                                                                                                                                                                                                                                                                                                                                        CC chemokine receptor 5 polypeptide - used to inhibit membrane fusion

a co-receptor for infection by macrophage-tropic (M-tropic) strains of HIV-1. The invention relates to the identification of a CCRS variant (see AAM89231), designated CCRS, one relates to the identification of a CCRS variant (see AAM89231), designated CCRS, one relation to the relation that the relation of the cCRS allele shows a presence of the CCRS 30 variant with the wild type CCRS allele shows a positive correlation with resistance to infection with M-tropic HIV-1 strains, and may indicate slower progression of the disease. The detection of CCRS variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AIDS. Probes and primers (see AAV84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCRS receptor. This involves introducing a nucleic acid encoding a CCRS variant into the cell, thereby reducing the number

This antigenic fragment binds to DC-SIGN or is exposed upon gp120 binding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gp120-binding C-type lectin. DC-SIGN binds ICAM-3 (which is expressed constitutively on T lymphocytes) with high affinity. The antibody of the invention inhibits the trans enhancement of HIV entry into a T cell or macrophage facilitated by dendritic cells. The antibody is useful to treat or prevent HIV infection. The present sequence represents a human CCRS protain, which is a translocation promoting agent that interacts with CD4. This receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; G-protein chemokine receptor; CCR5; HDGNR10; inflammation; HIV; human immunodeficiency virus; antimicrobial; vasodilator; vulnerary; cytostatic; immunosuppressive; nootropic; neuroperotective; gene therapy; neurodegenerative disorder; Kaposi's sarcoma; autoimmune disease; rheumatoid arthritis; cancer; breast; ovary, adrenal gland; bone marrow; gastrointestinal tract; lung; liver; immune disorder; Addison's disease; haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; allergy;

calls, HIV infection (such as Pneumocystis carini pheumonia or Kaposi's carcoma) or defective or aberrant Treell antigen presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection, such as an early stage HIV infection, a issease (e.g. a viral infection, or a poxvirus infection, an autoimmune disease (e.g. theumatoid arthritis) or a neurodegenerative disorder. The disease or disorder may be associated with aberrant CGRS expression, lack of CGRS infection, aberrant CRS ilgand expression, or lack of CGRS ligand function. CGRS HIDGRALD protein is used as a food additive or preservative to increase or decrease storage capabilities. CGR HIDGRALD DNA, protein, antibodies, agonists and antagonists are also useful in the disorders, agonists and antagonists are also useful in the disposits, treatment and prevention of cancer (breast, overy, adrenal urogenital); immune disorders (Adisson's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's is disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis); cardiovascular disorders (myocacdial ischaemias) and wound healing. The present sequence is human CCRS HDGRNIO protein

```
Isolated nucleic acid encoding a human G-protein chemokine receptor (CCR5) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human G-protein chemokine receptor (CCR5) HDGNR10 polypeptides and polynucleotides. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 102; Fig 1; 518pp; English.

or prostatio), organ rejection, inflammation and autoimmune diseases.

Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowel inflammation), or autoimmune diseases (rheumatoid arthritis or lupus), where the (cardio) vascular, lymphatic, respiratory, nervous, digestive, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives which have cytostatic, antiinflammatory, antiasthmatic, immunosuppressive, dermatological, antiirheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a constellation of chemokine receptors (CR), which control migration and proliferation of these cells. AG88045-AA680128 represent human chemokine fragments used to illustrate the method of the invention
Diagnostic agent containing two or more receptor-specific ligands, useful for detecting tumors, inflammation etc., also therapeutic use of ligand inhibitors.
                                                                                                                                                                     This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal

mammalian cell (I) that contains a  ${\rm CD4}$  gene, reporter gene for identification of drugs and antibodies for treatment of Transformed nand HIV LTR 1

```
The present invention relates to a transformed mammalian cell that contains a gene encoding CD4, a construct encoding a reporter gene under the regulation of an human immuno deficiency virus (HIV) long terminal repeat (LTR) and that has been transduced with a vector encoding a human chemokine receptor (CKR) where the CD4 and the CKR are present on the cell surface of transformed mammalian cell. The invention is useful for identifying drugs or antibodies that interfere with the translocation of HIV into transformed mammalian cell or for identifying a human chemokine receptor that facilitates the infection of a particular HIV strain into the transformed mammalian cell. Compounds identified can be used to treat cellular dysfunction and to prevent or combat HIV infection. The present cellular dysfunction has receptor (CKR), CC-CKR-5 related protein. CC-CKR-5 is the prinary macrophage-tropic strains of HIV-1

(HUMA-) HUMAN GENOME SCI INC

Li Y, Ruben SM; Rosen CA,

WPI; 2001-488965/53. N-PSDB; AAD13181. Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheunatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.

# Claim 102; Fig 1; 495pp; English

The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10 protein. CCR5 HDGNR10 cDNA is included in ATCC Deposit No: 97183. CCR5 HDGNR10 antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotaxis of immune cells. HIV infection (such as Pneumocystis carini commonia or Kaposi's sarcoma) or defective or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infection, a cytomegalovirus infection such as an early stage HIV infection, a cytomegalovirus infection, or a poxvirus infection), an infection, a cytomegalovirus infection, or a poxvirus infection), an infection, a cytomegalovirus infection, or a poxvirus infection), and catoline assets or disorder may be associated with aberrant CCR5 catoline and independent in the disease or disorder may be associated with aberrant CCR5 capters in a lack of CCR5 function, aberrant CCR5 ligand expression, or additive or preservative to increase or decrease storage capabilities. CCR5 HDGNR10 DNA are useful for chromosome identification and in gene therapy. CCR5 HDGNR10 DNA, protein, antibodies, agonists and antagonists are also useful in the diagnosis, treatment and prevention of cancer (breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, liver, lung, urogenital); immune disorders (Addison's disease, allegias, autoimmune thyroidisis, diabetes mellitus, collin's disease, multiple solerosis, rheumatoid arthritis and ulcerative collin's is cardiovascular disorders (Myocardial ischaemias) and wound

Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.

Example 40; Page 486-487; 495pp; English.

The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10

protein. CCR5 HDGNR10 antibodies are useful for treating, preventing or
ameliotaring a disease or disorder associated with inflammation,
defective or aberrant chemotastic fairmune cells, HIV infection (such as
considerating addisorder associated with inflammation,
defective or aberrant chemotastic fairmune cells, HIV infection (such as
aberrant T-cell antigaen presenting cell interaction. The disease or
disorder may also be an infection, a disorder with a infection, or a
considerative infection, an autoimmune disease (e.g. rheumatoid arthritis) or
a neurodegenerative disorder. The disease or disorder may be associated
with aberrant CCR5 expression, lack of CCR5 function, aberrant CCR5
is used as a food additive or preservative to increase or decrease
consideration and in gene therapy. CCR5 HDGNR10 DNA, protein,
contibodies, agonists and antagonists are also useful for chromosome
contibodies, agonists and antagonists are also useful in the diagnosis,
creatment and prevention of cancer (breast, ovary, adrenal gland, bone,
contibodies, agonists and antagonists, autoimmune haemolytic anaemia,
disorders (Adisaor's disease, allergies, autoimmune haemolytic anaemia,
autoimmune thyroiditis, diabetes mellitus, cardiovascular
content and prevential ischaemias) and wound healing

WPI; 2001-226317/23. N-PSDB; AAF26390 New human G-protein chemokine receptor polypeptides and polynucleotides, useful for identifying (ant)agonists to the G-protein chemokine receptor

Claim la; Page 15; 22pp; English.

This invention describes a novel receptor polypeptide (I) selected from filly defined 329 amino acid sequence (II) fully disclosed in the specification; and (ii) a polypeptide encoded by the CDNA contained in a plasmid, and fragments, analogs and derivatives of the polypeptide. The products of the invention have antiinflammatory, immunomodulatory, anticoagulant, antiallergic, immunosuppressive, vulnerary, cytostatic, antiparastic, antiparastic, antipheumatic, antiarchritic and vasotropic activity and can be used for gene therapy. The G-protein chemckine receptors, HDGNR10, (I) are useful for screening for compounds which activate or inhibit activation of (I). The products of the invention can also be used for stimulating haemacopoiesis, wound healing, coagulation, angiogenesis, treating solid tumours, chronic infections, leukemia, T-cell mediated autoimmune diseases, parastitic infections, psoriasis, and stimulating growth factor activity. HDGNR10 is useful for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying agonists of G protein-coupled receptors (GPCRs) for use in disease treatment, comprises contacting candidate compounds with versions of GPCRs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCR
allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IgE)-mediated allergic reactions, prostaglandin-independent fever, bone marrow failure, silicosis, sarcoidosis, rheumatoid arthritis, shock and hyperecionaphilic syndrome. This sequence represents the human CCRS protein sequence. The invention relates to a method for determining whether an agent is capable of modulating the interaction of chemotractic chemokine receptor 5 (CCRS) with gpl20, comprising incubating the agent with CCRS and gpl20 and determining whether the agent modulates the interaction, where gpl20 is associated with CDA, and where the interaction is a low affinity binding. The method is used to identify an agent capable of modulating the interaction of CCRS with gpl20, an agent capable of modulating the interaction of CCRS with gpl20, an agent capable of modulating the confittion associated with CCRS and gpl20 interaction, to treat a subject with a disease or condition associated with CCRS and gpl20 interaction, to treat a subject with a disease or condition associated with CCRS and gpl20 interaction, and for preparing a pharmaceutical for treating human immunodeficiency virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and cetects interaction of gpl20 with cells expressing only CCRS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of human HIV-1 co-receptor CCR5. Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-1 gp120-binding site that determines the specificity of the interaction between CCR5 and HIV-1 gp120. Post-translational sulfation of the tyrosine residues in the CCR5 N-terminus is required for gp120 binding and may critically modulate the susceptibility of target cells to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AAB82947) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These peptides are used in claimed methods of inhibiting HIV infection of CO4+ cells, of preventing CD4+ cells are infected with HIV, and of identifying an agent which inhibits binding of a CCR5 receptor. The methods may be carried cout in a subject, especially a human, infected (therapeutic method), not infected with HIV (prophylactic method), or in a subject who is not infected with, but has been exposed to, HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCRS) designated HDGNR10, and polynucleotide chemokine receptor (CCRS) designated HDGNR10 and polynucleotide corporates encoding it. The invention also describes antibodies that bind chuman G-protein chemokine receptor (CCRS) HDGNR10 and polynucleotide corporates inflammation, defective or aberrant chemotaxis of immune corporations (especially arthritis, neurodegeneration, viral inflammation, defective or aberrant chemotaxis of immune colls and T-cell/attigen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (expecially early-stage human immune deficiency virus (H1V), cytcmegalovirus or pox virus infections, Kaposi sarcoma, or conditions associated with aberrant or deficient expression of the CCRS receptor or its ligands. The antibodies are also useful to determine CCRS expression, e.g. for diagnosis, prognosis and monitoring of cancer and other chyperproliferative diseases. The polynucleotide sequences encoding human CG-protein chemokine receptor (CCRS) HDGNR10 can be used to produce the receptor and in the treatment of a wide range of diseases such as infectious diseases (e.g. influenza) neurological diseases (e.g. HDGNR10 #HDGNR10 #HDGNR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to the isolation of a movel human G-protein chemokine receptor (CCR5) designated HDGNR10, and polymucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCR5) HDGNR10 and polymucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antigen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (especially early-stage human immune deficiency virus (HIV), cytomegallovitus or pox virus infections, Kaposi sarcoma, or conditions associated with aberrant or deficient expression of the CCR5 receptor or its ligands. The antibodies are also useful to determine CCR5 expression, e.g. for diagnosis, prognosis, and monitoring of cancer and other hyperproliferative diseases. The polymucleotide sequences encoding human G-protein chemokine receptor (CCR5) HDGNR10 can be used to produce the receptors, and in the treatment of a wide range of diseases such as infectious diseases (e.g. cancer). The Horman as the expression of the seases (e.g. present sequence represents human G-protein chemokine receptor (CCR5) HDGNR10 can be used to produce the receptors and hyperproliferative disorders (e.g. cancer). The Horman and Amendal Amendal diseases (e.g. encoments) and hyperproliferative disorders (e.g. cancer). The Horman Amendal Amendal diseases and Horman Amendal Amendal diseases.

The invention relates to a method for identifying a binding compound for a chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CCR5, and then central those molecules which be invention also relates to constitute those molecules which bind. The invention also relates to construct the consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CCR5, a computer-aided method for identifying consensus motifs for CCR5-binding peptides, a computer aided drug screening assay that utilises the three-dimensional a computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods for the invention are useful for treating or preventing the methods of the invention are useful for treating or preventing HTM (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to sidentify agonists or antagonists of the interaction of CCR5 with its natural ligand, and to determine a binding motif for CCR5. The present sequence represents a naturally occurring variant of human CCR5 in which

Identifying CC chemokine receptor 5 binding compound for treating AIDS, comprises binding a molecule from library to a molecule having binding property corresponding to CCRS and identifying bound molecule.

The present invention relates to the isolation of human G-protein chemokine receptor, HDGNR10 (CCRS receptor), and the polymucleotide sequences are conciding it. HDGNR10 polymetide and polymucleotide sequences are or useful for diagnosing a disease or a susceptibility to a disease related to underexpression of HDGNR10. They are useful for identifying modulators for stimulating haematopolesis, wound healing, coaqulation, angiogenesis, to treat solid tumours, chronic infections, psoriasis, or for stimulating growth factor activity. The sequences are also useful for preventing and/or treating allargy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin B (IgB)-mediated allargic reactions, prostaglandin-independent fever, bone marrow failure, sarcoidosis, rheumatoid arthritis, shock and hypercessinophilic syndrome. Polymucleotide sequences encoding HDGNR10 can be used in gene therapy to treat conditions related to underexpression of HDGNR10. The present sequence represents human G-protein chemokine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

```

```
The invention describes an isolated polynucleotide encoding a first antibody at least 95-100% identical to a second antibody consisting of an amino acid sequence comprising at least one, three CDR regions of a variable heavy (VH) or variable light (VL) domain of the antibody expressed by a hybridoma cell line consisting of XF3.5F1, XF11.1F8, XF27/28.1851, XF27/28.1851, XF27/28.1851, XF27/28.1852, XF27/28.1851, XF27/28.1852, XF27/28.1851, XF27/28.1852, XF27/28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seguence of huma
